## PREFACE

This research report presents the results of the 2009 statewide performance tests of soybean, sorghum grain and silage, sunflower and summer annual forages. The tests for various evaluations were conducted at several or all of the following locations: Tifton, Plains and Midville in the Coastal Plain region; Griffin and Athens in the Piedmont region; and Calhoun in the Limestone Valley region. To identify the test site locations, consult the map inside the back cover of this report.

Agronomic information, such as plant height, lodging, disease occurrence, etc., is listed along with the yield data. Information concerning planting and harvest dates, soil type, and culture and fertilization practices used in each trial is included in footnotes. Since the average yield for several years gives a better indication of a variety's potential than one year's data, multiple-year yield summaries have been included.

In order to have a broad base of information, a number of varieties, including experimental lines, are included in the trials, but this does not imply that all are recommended for Georgia. Varieties best suited to a specific area or for a particular purpose, and agreed upon by College of Agricultural and Environmental Sciences agronomists, are presented in the 2009 Spring Planting Schedule for Georgia (available from your county Extension office). Pesticides used for production practices are included for the benefit of the reader and do not imply any endorsement or preferential treatment by the University of Georgia Agricultural Experiment Station. For additional information, contact your local county Extension agent or the nearest experiment station.

The least significant difference (LSD) at the 10% level has been included in the tables to aid in comparing hybrids. If the yields of any two hybrids exceed the LSD value or more, they may be considered different in yield ability. **Bolding** is used in the performance tables to indicate hybrids with yields statistically equal to the highest yielding entry in the test. The standard error (Std. Err.) of an entry mean is included at the bottom of each table to provide a general indicator of the level of precision of each experiment. The lower the value of the standard error of the entry mean, the more precise the experiment.

This report is one of four publications presenting the 2009 performance of agronomic crops in Georgia. For more information concerning other crops, refer to one of the following research reports: 2009 Corn Performance Tests (Annual Publication #101), 2008-2009 Small Grains Performance Tests (Annual Publication #100), 2008-2009 Canola data ([www.swvt.uga.edu/canola.html](http://www.swvt.uga.edu/canola.html)) and 2008 Peanut, Cotton and Tobacco Performance Tests (Research Report 719).

This report, along with performance test information on other crops, is also available on our Web site: **[www.swvt.uga.edu](http://www.swvt.uga.edu)**. Additional information may be obtained by writing J. LaDon Day, Crop and Soil Sciences Department, University of Georgia, Griffin Campus, 1109 Experiment Street, Griffin, GA 30223-1797.

## **The Season**

Unlike the three previous droughty springs, 2009 was slowed by wet and cold conditions in late March and early April. Wet conditions and low soil temperatures continued during mid-spring to late spring, causing planting delays. Overall, this was the latest planted spring crop in many years. Spring temperatures were cooler than normal until late May into June when there was a period of near record high temperatures, especially during the first two weeks of June. This period challenged irrigation systems to continue supplying adequate moisture for germinating crops. Wet and cool conditions returned in late fall, causing a virtual halt in harvest and reducing quality of a late maturing crop. At the end of the year, up to 30% of most commodities remained in the field unharvested due to saturated soil unable to support combine equipment.

Rainfall amounts recorded monthly at the six test locations in Georgia during the 2009 growing season are presented in the following table. On June 10, 2009, water restrictions were cancelled across the state for the first time in three years. This was due to above-normal rainfall during late winter and spring (the second wettest spring on record in Georgia). Many monthly total and seasonal rainfall amounts at all of the Variety Research locations were above normal for the first time in many years. The surplus, averaged across sites, was over 10 inches for the nine-month reporting period.

## **2009 Rainfall<sup>1</sup>**

Month	Athens <sup>2</sup>	Calhoun <sup>3</sup>	Griffin	Midville	Plains	Tifton
----- inches -----						
March	8.05	5.90	8.52	4.54	7.67	8.23
April	4.43	4.11	3.89	5.84	5.09	8.26
May	4.03	6.09	3.71	9.54	7.09	6.54
June	0.98	0.91	1.73	1.99	2.71	1.98
July	2.09	3.88	4.40	3.69	2.65	7.78
August	3.96	5.50	3.34	7.64	6.90	7.02
September	10.74	6.10	3.24	3.74	1.66	1.70
October	8.98	8.96	8.81	3.68	5.46	4.01
November	5.43	5.19	6.59	4.31	2.65	2.64
Total	48.69	46.64	44.23	44.97	41.88	48.16
Normal (9 mo)	36.76	38.89	36.77	33.95	35.29	35.11

1. Georgia data provided in part by Dr. G. Hoogenboom, Georgia Station, Griffin, GA.

2. Plant Sciences Farm.

3. Floyd County location.

Crop maturity progressed at 15 to 20% below the five-year average, and persistent rain and wet soil throughout the fall delayed an already late harvest season. Soybean producers increased acreage 10% above last year, which was 60% greater than two years ago. State yield per acre of 33 bushels for soybeans matched the 2003 record and production was almost 15 million bushels, the most produced in the state since 1994. Grain sorghum planting remained the same at 55,000 acres. Sorghum silage harvest held steady, but yields of 14 tons/acre pushed production up 17%. All other forage production was up 25% more than last year. Although commodities' prices remain higher than the long-term average, high production costs continue to reduce profit margins, due mainly to high energy prices.

Soybean rust was again found in Georgia this growing season, but as in 2008 did not spread into a limiting factor. Rust did not develop into a major problem, apparently due to an increase in spraying fungicide coupled with the hot weather conditions. The threat remains very serious to soybean production in Georgia due mainly to the ease at which this rust overwinters in deep south Georgia and in north Florida.

## **Regional Summary of Late-Planted Soybean Variety Performance, 2009 (Continued)**

---

1. Yields calculated at 13% moisture.
2. Plains.
3. Griffin.
4. The F-test indicated no statistical differences at the alpha = .10 probability level; therefore a LSD value was not calculated.

**Bolding** within each test denotes entries with yields equal to the highest yielding entry based on Fisher's protected LSD ( $P = 0.10$ ).

## Tifton, Georgia: Early-Planted Soybean Variety Performance, 2009, Irrigated (Continued)

---

\* 2008-2009.

1. Yields calculated at 13% moisture.
2. Lodging rating: Rated 1 (all plants erect) to 5 (over 80% of plants down).
3. Seed quality rating: Rated 1 (very good) to 5 (very poor).
4. Shattering rating: Rated 1 (no shattering) to 5 (>50% pods shattered).
5. CV = 8.8% and df for EMS = 68.
6. The F-test indicated no statistical differences at the alpha = .10 probability level; therefore, a LSD value was not calculated.
7. CV = 10.8% and df for EMS = 44.
8. CV = 0/4% and df for EMS = 84.

**Bolding** within each test denotes entries with yields equal to the highest yielding entry based on Fisher's protected LSD (P = 0.10).

Planted: June 1, 2009.

Harvested: Maturity Groups V and VI - October 22, 2009  
Maturity Group VII and VIII - November 3, 2009

Seeding Rate: Eight seeds per foot in 30" rows.

Soil Type: Tifton loamy sand.

Soil Test: P = High, K = High, and pH = 6.4.

Fertilization: 0 lb N, 0 lb P<sub>2</sub>O<sub>5</sub>, and 96 lb K<sub>2</sub>O/acre.

Previous Crop: Corn.

Management: Disked, subsoiled and bedded, rototilled; Treflan, Storm, Select, Poast and Classic used for weed control; Temik, Tracer and Mustang Max used for insect control; irrigated 6.0 inches.

Test conducted by A. E. Coy, R. E. Brooke, and D. G. Dunn.

**Plains, Georgia:  
Early-Planted Soybean Variety Performance, 2009, Irrigated  
(Continued)**

---

\* 2008-2009.

1. Yields calculated at 13% moisture.
2. Lodging rating: Rated 1 (all plants erect) to 5 (over 80% of plants down).
3. Seed quality rating: Rated 1 (very good) to 5 (very poor).
4. Shattering rating: Rated 1 (no shattering) to 5 (>50% pods shattered).
5. CV = 8.9% and df for EMS = 68.
6. CV = 11.1% and df for EMS = 44.
7. The F-test indicated no statistical differences at the alpha = .10 probability level; therefore, a LSD value was not calculated.
8. CV = 11.9% and df for EMS = 84.

**Bolding** within each test denotes entries with yields equal to the highest yielding entry based on Fisher's protected LSD (P = 0.10).

Planted: June 17, 2009.

Harvested: November 20, 2009.

Seeding Rate: Eight seeds per foot in 30" rows.

Soil Type: Greenville sandy loam.

Soil Test: P = Medium, K = Medium, and pH = 6.1.

Fertilization: 20 lb N, 80 lb P<sub>2</sub>O<sub>5</sub>, and 80 lb K<sub>2</sub>O/acre.

Previous Crop: Cotton.

Management: Disked, subsoiled, and rototilled; Reflex, Prowl, and First Rate used for weed control; irrigated 1.0 inch.

Test conducted by A. E. Coy, R. E. Brooke and D. G. Dunn.

## Midville, Georgia: Early-Planted Soybean Variety Performance, 2009, Irrigated (Continued)

---

\* 2008-2009.

1. Yields calculated at 13% moisture.
2. Lodging rating: Rated 1 (all plants erect) to 5 (over 80% of plants down).
3. Seed quality rating: Rated 1 (very good) to 5 (very poor).
4. Shattering rating: Rated 1 (no shattering) to 5 (>50% pods shattered).
5. CV = 12.0% and df for EMS = 68.
6. The F-test indicated no statistical differences at the alpha = .10 probability level; therefore, a LSD value was not calculated.
7. CV = 11.0% and df for EMS = 44.
8. CV = 10.7% and df for EMS = 84.

**Bolding** within each test denotes entries with yields equal to the highest yielding entry based on Fisher's protected LSD (P = 0.10).

Planted: June 10, 2009.

Harvested: November 17, 2009.

Seeding Rate: Eight seeds per foot in 30" rows.

Soil Type: Tifton loamy sand.

Soil Test: P = High, K = High, and pH = 6.2.

Fertilization: 18 lb N, 46 lb P<sub>2</sub>O<sub>5</sub>, and 80 lb K<sub>2</sub>O/acre.

Previous Crop: Cotton.

Management: Disked, subsoiled and bedded, rototilled; Valor and Prefix used for weed control; irrigated 6.0 inches.

Test conducted by A. E. Coy, R. E. Brooke and D. G. Dunn.

\* 2008-2009

1. Yields calculated at 13% moisture.

2. Lodging rating: Rated 1 (all plants erect) to 5 (over 80% of plants down).

3. Seed quality rating: Rated 1 (very good) to 5 (very poor).

4. Shattering rating: Rated 1 (no shattering) to 5 (>50% pods shattered).

5. CV = 10.4% and df for EMS = 68.

6. The F-test indicated no statistical differences at the alpha = .10 probability level; therefore, a LSD value was not calculated.

7. CV = 9.2% and df for EMS = 44.

**Bolding** within each test denotes entries with yields equal to the highest yielding entry based on Fisher's protected LSD (P = 0.10).

Planted: May 15, 2009.

Harvested: October 26, 2009

Seeding Rate: Eight seeds per foot in 30" rows.

Soil Type: Pacolet coarse sandy loam.

Soil Test: P = High, K = Very High, and pH = 5.9.

Fertilization: 30 lb N, 60 lb P<sub>2</sub>O<sub>5</sub>, and 90 lb K<sub>2</sub>O/acre.

Previous Crop: Corn.

Management: Chisel plowed, disked and rototilled; Roundup used on RR lines, Lasso and Poast used on conventional lines for weed control; irrigated 10.0 inches.

Test conducted by J. Gassett and G. Ware.

## Griffin, Georgia: Early-Planted Soybean Variety Performance, 2009, Irrigated (Continued)

---

\* 2008-2009

1. Yields calculated at 13% moisture.
2. Lodging rating: Rated 1 (all plants erect) to 5 (over 80% of plants down).
3. Seed quality rating: Rated 1 (very good) to 5 (very poor).
4. Shattering rating: Rated 1 (no shattering) to 5 (>50% pods shattered).
5. CV = 9.7% and df for EMS = 84.
6. The F-test indicated no statistical differences at the alpha = .10 probability level; therefore, a LSD value was not calculated.

**Bolding** within each test denotes entries with yields equal to the highest yielding entry based on Fisher's protected LSD (P = 0.10).

Planted: July 9, 2009.

Harvested: November 20, 2009.

Seeding Rate: Eight seeds per foot in 30" rows.

Soil Type: Cecil sandy clay loam.

Soil Test: P = Medium, K = High, and pH = 6.2.

Fertilization: 30 lb N, 60 lb P<sub>2</sub>O<sub>5</sub>, and 90 lb K<sub>2</sub>O/acre.

Previous Crop: Corn.

Management: Chisel plowed, disked and rototilled; Roundup used on RR lines, Lasso and Poast used on conventional lines for weed control; irrigated 8.0 inches.

Test conducted by J. Gassett and G. Ware.

## Athens, Georgia: Early-Planted Soybean Variety Performance, 2009, Irrigated (Continued)

---

\* 2008-2009.

1. Yields calculated at 13% moisture.
2. Lodging rating: Rated 1 (all plants erect) to 5 (over 80% of plants down).
3. Seed quality rating: Rated 1 (very good) to 5 (very poor).
4. Shattering rating: Rated 1 (no shattering) to 5 (>50% pods shattered).
5. CV = 11.0% and df for EMS = 68.
6. CV = 10.0% and df for EMS = 44.
7. The F-test indicated no statistical differences at the alpha = .10 probability level; therefore, a LSD value was not calculated.
8. CV = 8.4% and df for EMS = 84.

**Bolding** within each test denotes entries with yields equal to the highest yielding entry based on Fisher's protected LSD (P = 0.10).

Planted: May 15, 2009.

Harvested: Maturity Group V - October 26, 2009

Maturity Group VI - November 9, 2009.

Maturity Group VII & VIII - November 7, 2009.

Seeding Rate: Eight seeds per foot in 30" rows.

Soil Type: Maturity Groups V, VII and VIII: Wedowee coarse sandy loam.

Maturity Group VI: Appling coarse sandy loam.

Soil Test: Maturity Groups V, VII and VIII: P = Medium, K = Medium, and pH = 6.4.

Maturity Group VI: P = High, K = Low, and pH = 5.7.

Fertilization: 0 lb N, 52 lb P<sub>2</sub>O<sub>5</sub>, and 105 lb K<sub>2</sub>O/acre.

Previous Crop: Maturity Groups V, VII and VIII: Wheat.

Maturity Group VI: Cotton.

Management: Chiseled and disked; First Rate, Dual Magnum, Classic, and one cultivation used for weed control; subsoiled between rows after cultivation; Telone II used for nematode control; Domark 230e used for rust control; Maturity Groups V, VII and VIII irrigated 5.0 inches; Maturity Group VI irrigated 6.0 inches.

Test conducted by E. D. Wood, G. B. Bishop, S. L. Finnerty, W. E. Baxter, H. B. Chambers, C. T. Collins, H. J. Yeomans and R. B. Baerne.

\* 2008-2009.

1. Yields calculated at 13% moisture.

2. Lodging rating: Rated 1 (all plants erect) to 5 (over 80% of plants down).

3. Seed quality rating: Rated 1 (very good) to 5 (very poor).

4. Shattering rating: Rated 1 (no shattering) to 5 (>50% pods shattered).

5. CV = 9.2% and df for EMS = 63.

6. The F-test indicated no statistical differences at the alpha = .10 probability level; therefore, a LSD value was not calculated.

7. CV = 11.1% and df for EMS = 44.

**Bolding** within each test denotes entries with yields equal to the highest yielding entry based on Fisher's protected LSD (P = 0.10).

Planted: May 21, 2009.

Harvested: Maturity Group V - November 4, 2009  
Maturity Group VI - November 5, 2009

Seeding Rate: Eight seeds per foot in 30" rows.

Soil Type: Waynesboro loam.

Soil Test: Maturity Group V: P = High, K = High, and pH = 5.4.

Maturity Group VI: P = Very High, K = High, and pH = 6.2.

Fertilization: 18 lb N, 45 lb P<sub>2</sub>O<sub>5</sub>, and 90 lb K<sub>2</sub>O/acre.

Previous Crop: Maturity Group V: Corn

Maturity Group VI: Soybeans

Management: Moldboard plowed, disked, and rototilled; Roundup used on RR lines, Treflan, Classic, Arrow, Basagran and one cultivation used on conventional lines for weed control; irrigated 8.0 inches; Maturity Group V - applied 1 ton lime/acre.

Test conducted by J. Gassett, G. Ware and J. Stubbs.

FL	FGS-0620	24.3	28.1	.	.	.	.
Average		69.5 <sup>3</sup>	68.6	50.5	63	45	.
LSD at 10% Level		19.7	15.3	2.9	3	4	.
Std. Err. of Entry Mean		8.3	6.5	1.2	1	2	.

1. Yields calculated at 14% moisture.

2. Days from planting to 50% bloom.

3. CV = 23.9% and df for EMS = 51.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: April 24, 2009.

Harvested: September 2, 2009.

Seeding Rate: 140,000 seed/acre in 30" rows.

Soil Type: Tifton loamy sand.

Soil Test: P = Low, K = Medium, and pH = 6.3.

Fertilization: Preplant: 75 lb N, 75 lb P<sub>2</sub>O<sub>5</sub>, and 75 lb K<sub>2</sub>O/acre. Sidedress: 125 lb N/acre.

Previous Crop: Peanuts.

Management: Disked, subsoiled and bedded, rototilled; one cultivation used for weed control; Lorsban used for insect control.

Test conducted by A. E. Coy, R. E. Brooke and D. G. Dunn.

## **Sorghum Midge Resistance in 18 Grain Sorghum Hybrids, 2009**

Xinzhi Ni and Jeffrey P. Wilson

Grain sorghum is a good rotation crop in the southern Coastal Plain region, where it is impacted by a variety of cyclic insects and pathogens from the seedling stage through maturity. Diseases were of minimal importance in 2009. Although their damage was not as high as in 2008, 10 insect pests were recorded on sorghum in southern Georgia in 2009. They were, in order of importance for 2009: fall armyworm, sorghum webworm, sorghum midge, stink bugs (southern green and brown stink bugs), leaf-footed bug, chinch bug, corn earworm and aphids (corn leaf aphid and greenbug).

Eighteen hybrids were evaluated for resistance to sorghum midge in 2009. The hybrids were planted with four replications on May 7, 2009. The flowering date (or days to anthesis) was recorded during July. Sorghum midge damage was rated on August 10, 2009. Midge damage was rated according to the visual estimates of grain loss. Grain loss caused by midge infestation can be separated from other factors using the whitish-cast skins hanging at the tip of glumes during pre-harvest examination. Sorghum midge damage was assessed according to the following rating scale: Very Good = 0 - 15% of empty glumes on any of the sorghum panicles in an experimental plot; Good = a few empty glumes (16-30%) observed on a panicle; Fair = 31-75% of empty glumes on a sorghum panicle; and Poor = majority of sorghum panicles with more than three quarters (> 75%) of empty glumes.

The sorghum midge is a cyclic insect pest in grain sorghum production in the southern Coastal Plain region. The overall damage caused by sorghum midge is usually high on late flowering hybrids. Midge damage was low in general for 2009, which could be the result of earlier planting in 2009. The current test was planted on May 7, 2009, while the planting date for previous year was June 16, 2008. Most of the entries (14 of the 18 entries) were rated as Very Good (VG). Three hybrids were rated good (G), one hybrid was rated as Fair (F), and no hybrids were rated Poor for 2009. Please refer to the table on next page for more details.

It is highly recommended that growers use available insect and disease-resistant hybrids, which is one of the most economical pest management strategies for sorghum production in our region. For further integrated insect management information, consult with your local county agent and/or Extension entomologists.

This test was maintained and flowering-date data were collected by Charles Mullis and Penny Tapp from the Crop Genetics and Breeding Research Unit, USDA-ARS, Coastal Plain Experiment Station, UGA-Tifton, Georgia.

Average		998 <sup>4</sup>	.	61	10	.	78	11
LSD at 10% Level								
Std. Err. of Entry Mean								

1. Yields calculated at 10% moisture.

2. Days from planting.

3. Percent of grain head damaged.

4. CV = 32.9% and df for EMS = 63.

**Bolding** indicates entries yielding equal to highest yielding entry within a column based on Fisher's protected LSD (P = 0.10).

Planted: May 13, 2009, replanted July 15, 2009.

Harvested: October 22, 2009.

Seeding Rate: 20,000 seed/acre in 30" rows.

Soil Type: Waynesboro loam.

Soil Test: P = High, K = Very High, and pH = 6.6.

Fertilization: Preplant: 21 lb N, 54 lb P<sub>2</sub>O<sub>5</sub>, and 108 lb K<sub>2</sub>O/acre.

Previous Crop: Soybeans.

Management: Moldboard plowed, disked and rototilled; Prowl and three cultivations used for weed control.

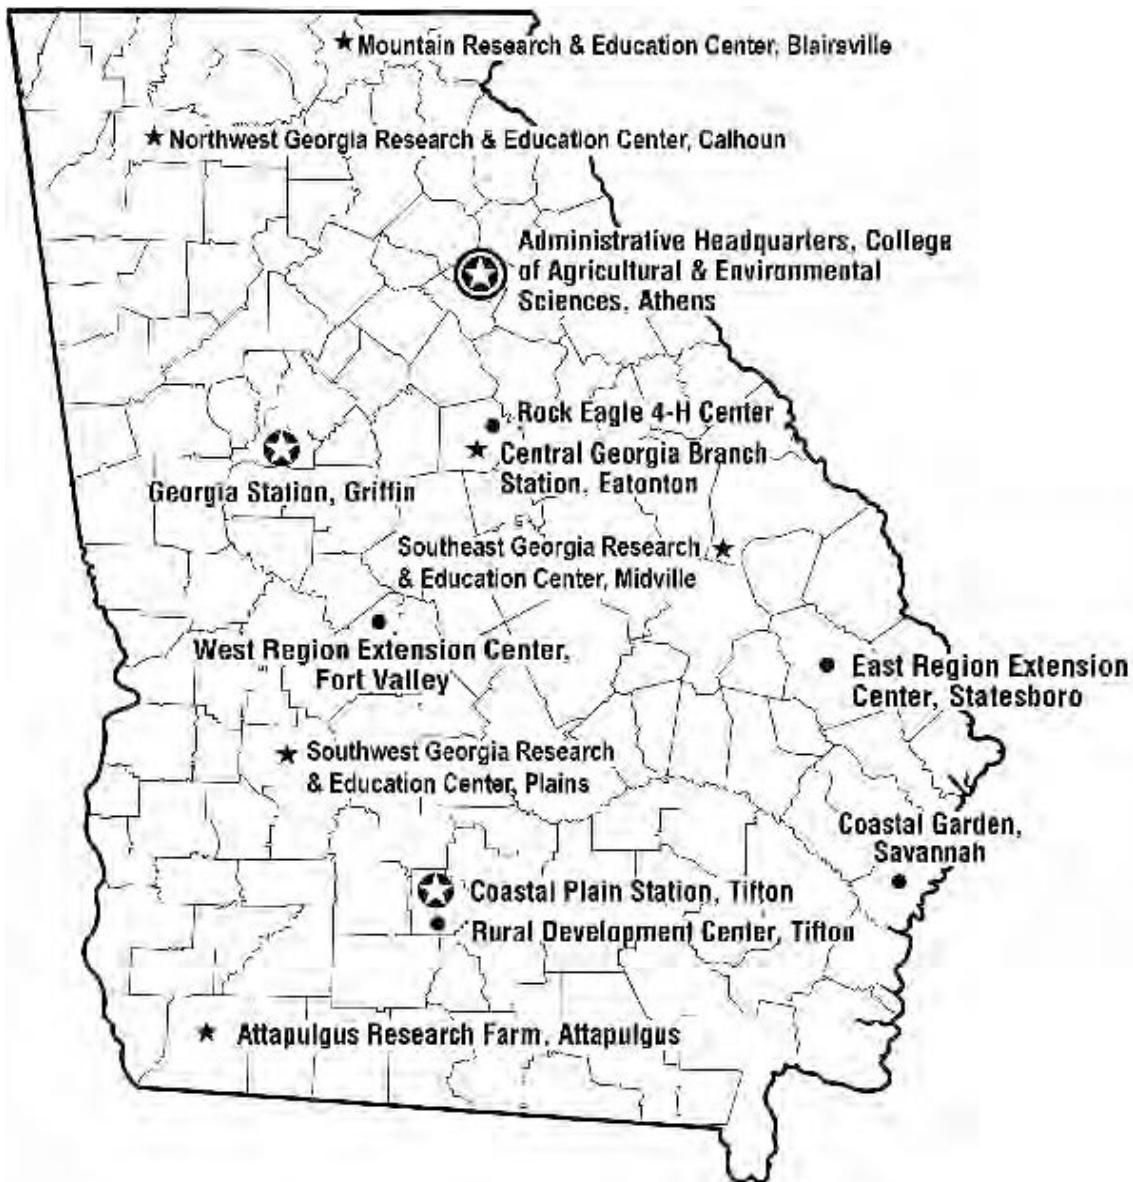

Test conducted by J. Gassett, G. Ware, and J. Stubbs.

## ***“CERTIFIED SEED DOESN’T COST ... IT PAYS”***

### **HERE’S WHY:**

- Known performance of varieties adapted to your area.
- A pedigree record that begins with the release of Breeder seed and continues until it reaches the consumer as Certified (blue tag) seed.
- Field inspected for trueness to variety and inseparable from other crop and weed seed.
- Certified seed can only be conditioned in an approved facility.
- Certified seed must meet High Quality standards as to germination and purity.
- Free of noxious weeds.

*The planting of CERTIFIED SEED eliminates many of the risks associated with crop production. For sources of Certified seed, contact your local county Extension agent or the Georgia Crop Improvement Association, Inc. (706-542-2351)*
